ABSTRACT

Before “**CHARISM**”, Community Service activities were handled through the use of paper forms and manual methods for attendance tracking, with multiple sources of documentation for each student. Unforeseen errors often created inefficiencies for both the students and leaders involved in these activities. Additionally, allow students to have a quicker means to complete their Community Service Requirements without needing to rely upon an inefficient, time-consuming process of managing paper forms. To alleviate many of these problems, CHARISM has been developed as an Internet-based application to provide an accurate, efficient, and uncomplicated way for students to log their service hours. CHARISM's user interface allows students, as well as staff and administrators, to easily log, view, and verify their volunteer hours. The system provided a clear interface for students, staff and Admins to track and validate volunteer hours. The **ISO 25010** and the Technology Acceptance Model for User Acceptance and User Experience were used to evaluate the system from the perspectives of both users and IT specialists. CHARISM was built using the Agile Method of software development, which meant the CHARISM software was continuously improved and feedback on its performance was regularly requested. Users found CHARISM to be a highly reliable, usable, and accepted solution, as well as an accurate, efficient, and easy-to-use system. Overall, CHARISM fulfills the need for three significant groups within the university community and provides an effective solution to these groups.

COMMUNITY EVENTS

OBJECTIVES

Develop a web-based platform to centralize community engagement services.

Implement electronic logging and automated verification of student service hours.

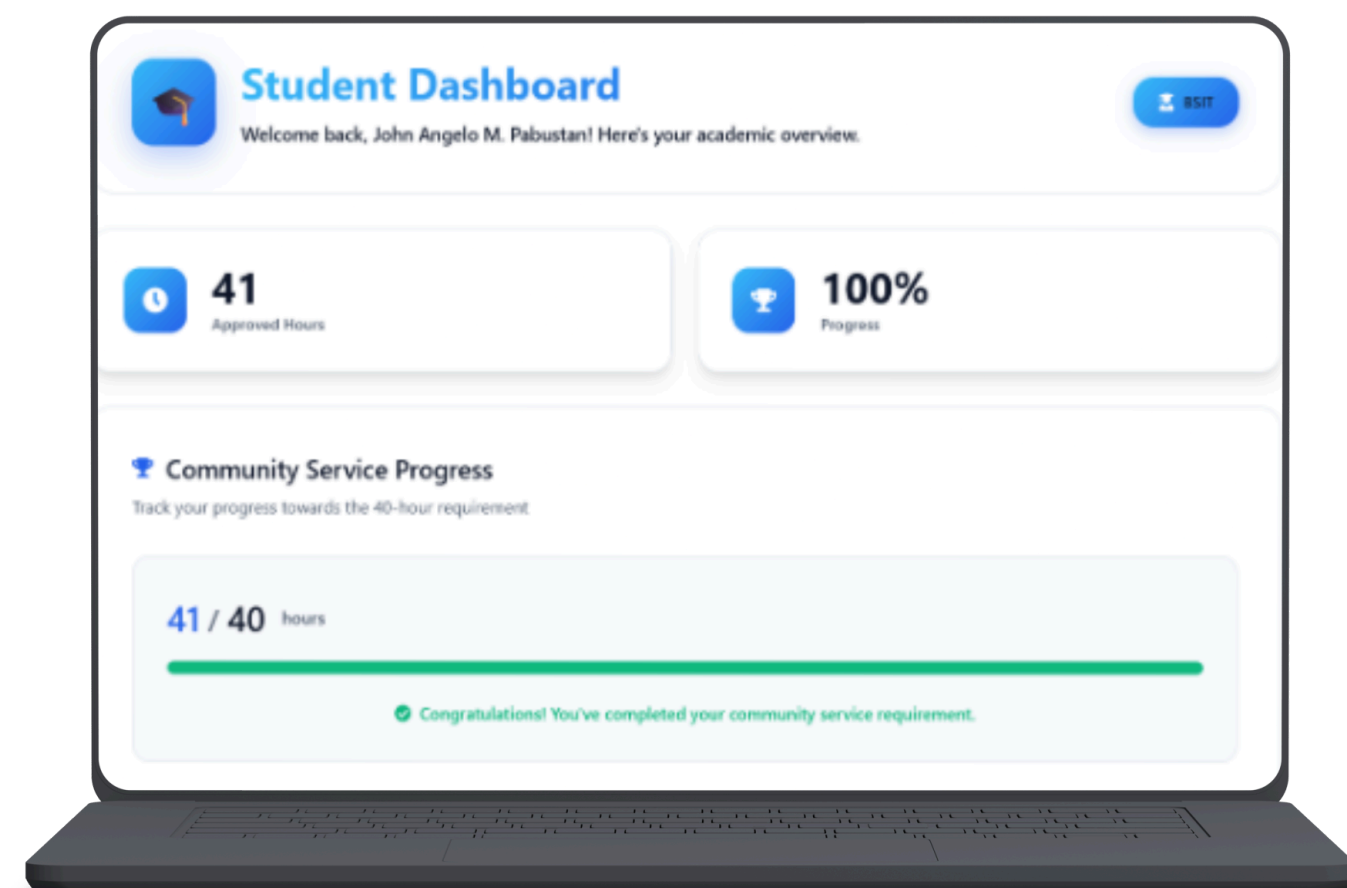

Integrate real-time dashboards for transparent participation monitoring.

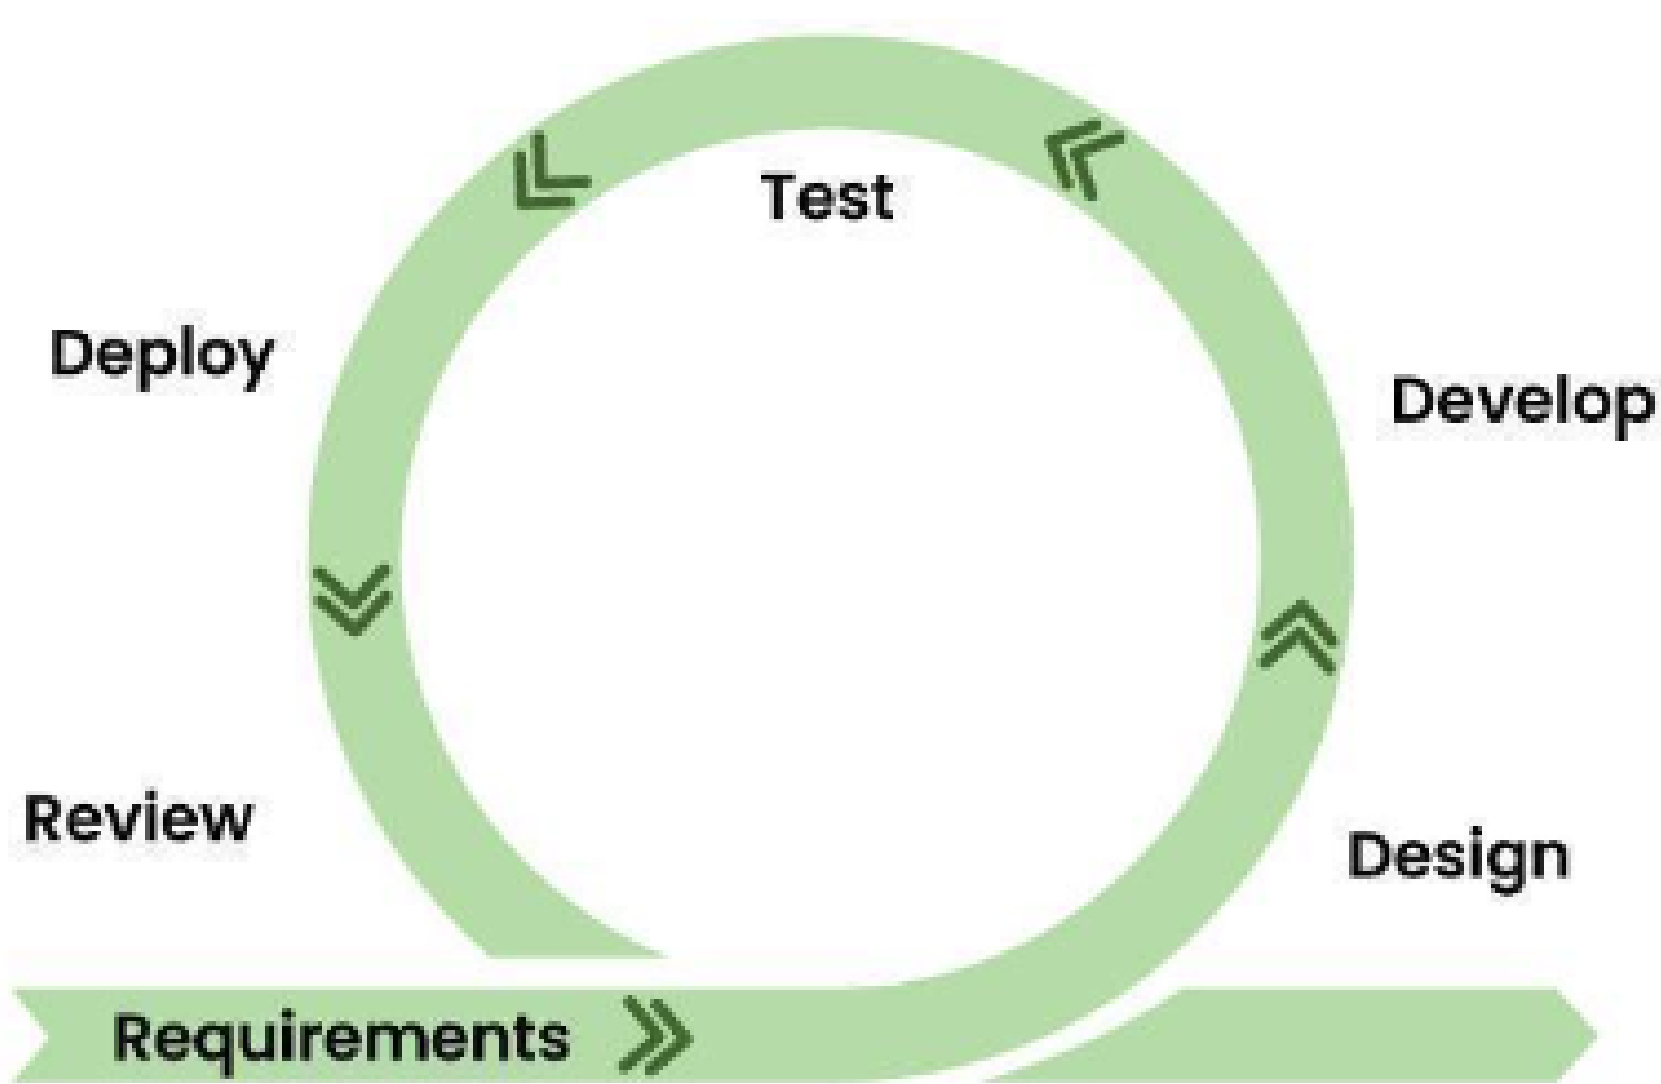

Conduct a pilot assessment to evaluate CHARISM’s usability and effectiveness.

Analyze the impact of CHARISM in supporting community outreach, volunteerism, and accurate service-hour documentation.

METHODOLOGY

The study adopted an Agile SDLC approach in developing the **CHARISM** Web Application. System requirements were gathered through stakeholder consultations and analysis of existing manual processes. The system was then designed with emphasis on usability and role-based access. Development was conducted iteratively, followed by testing and evaluation using ISO/IEC 25010 and the **Technology Acceptance Model (TAM)** to assess system quality and user acceptance.

Main Results and Conclusion

CHARISM Transforms how community service is managed the University Of The Assumption

Centralized Documentation

Paper-based records replaced with a unified online system

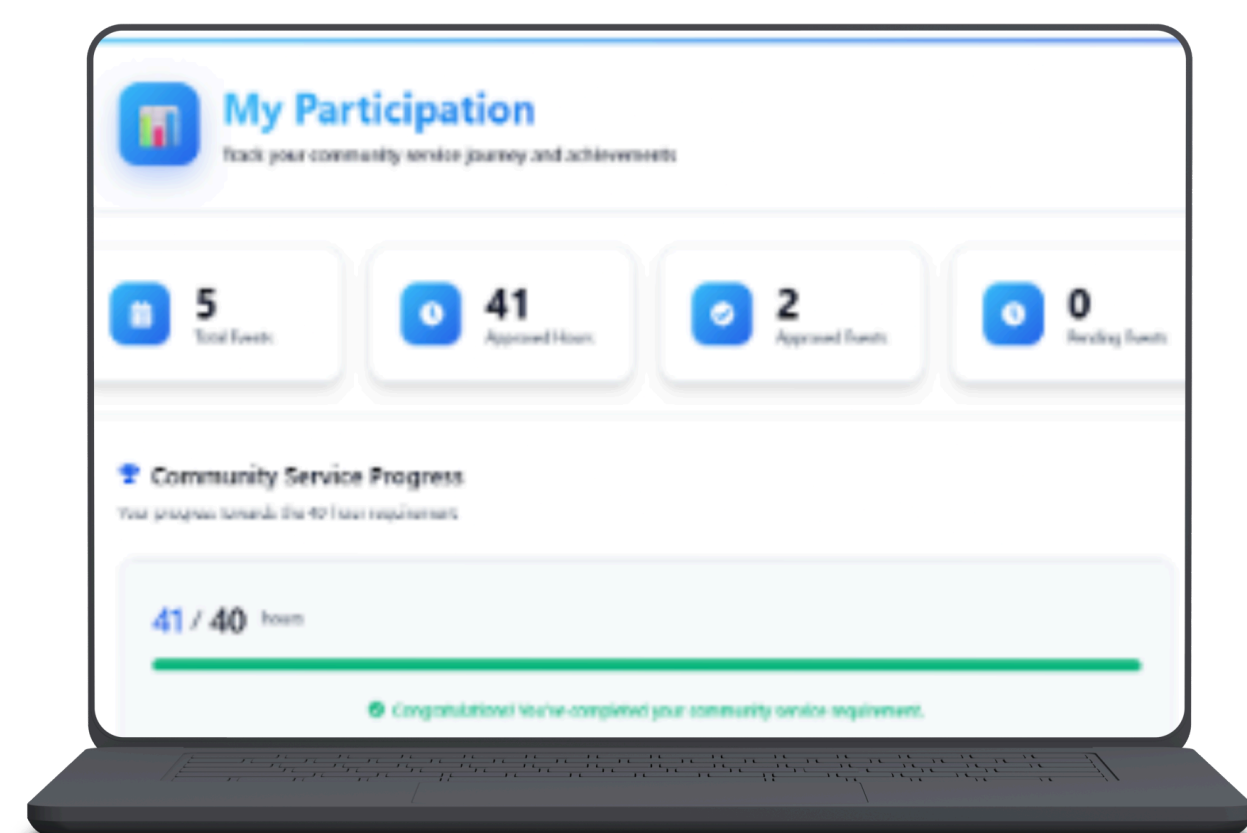

Accurate Hour Validation

Automated and verified service-hour tracking

Efficient Monitoring

Real-time dashboards for students and administrators
