ABSTRACT

This study developed "ResiLinked," a web-based job portal designed to enhance employment accessibility for informal workers in selected barangays in the City of San Fernando, Pampanga. Informal workers often face exclusion from digital economies due to low literacy and the credential-based nature of mainstream platforms. The study employed a mixed-methods research design, utilizing the Rapid Application Development (RAD) model for system creation. Data were collected through qualitative interviews, expert evaluations, and a quantitative survey of 100 respondents using ISO/IEC 25010 and the Technology Acceptance Model (TAM). Findings revealed that the platform achieved "Very High" ratings for usability, performance efficiency, and perceived usefulness, effectively bridging the digital divide through localized, skill-based matching. Recommendations include the development of a native mobile application and the integration of digital payment gateways to further support the informal economy.

Keywords: Informal workers, Job portal, Technology Acceptance Model, ISO 25010, Localized employment, Digital inclusion.

OBJECTIVES

- Improve job accessibility for informal workers through a digital platform.
- Ensure the platform is usable for individuals with low digital and reading literacy.
- Measure the efficiency and responsiveness of the system.
- Assess the level of trust and confidence informal workers have in using the platform.
- Assess the perceived impact on employment opportunities and livelihood confidence.

METHODS

Research Design: Mixed methods approach (ISO/IEC 25010 and TAM).

System Development: Rapid Application Development (RAD) model.

Participants & Setting: Conducted in San Fernando, Pampanga with informal workers.

Instruments: Interview guides, technical checklists, and validated surveys (ISO/IEC 25010 & TAM).

Data Analysis: Thematic analysis for qualitative data (interviews), descriptive statistics for quantitative data (surveys).

DISCUSSION

ResiLinked utilizes a scalable web-based architecture evaluated via ISO/IEC 25010 and TAM to effectively improve job accessibility and strengthen community trust.

Employment and Platform Challenges of Informal Workers Interviews revealed barriers regarding language and safety, which ResiLinked addresses through a localized Tagalog interface and safer, barangay-level verification.

RESULTS

- Achieved a "Very High" overall technical rating with a mean of 3.59.
- Security and Functional Suitability scored highest, ensuring robust protection and utility.
- Consistent expert evaluations confirm the system meets industry quality standards.
- Attained a "Very High" user acceptance score with a final mean of 3.71.
- High ratings for Ease of Use confirm the interface is intuitive for workers.
- Strong Behavioral Intention scores show users are eager to adopt the platform.
